LORP Synopsis for October 2015

Compliance Comments

Flows were above the minimum flow for the month.

The raw data for LOR @ Mazourka Canyon Road from 9/28/15 through 10/29/15 was lost due to a faulty sensor. Although the raw data was lost, the daily averages were retained through the LORP Daily Reports.

Maintenance

Activities for the month on the Lower Owens River included the following:

- Current metering continues the development of discharge curves at all in-river flow monitoring sites and are used to develop velocity indexing tables.
- Some in-river station measurements have fluctuated as a result of shifting and increased sedimentation in the river, requiring additional indexing to increase the accuracy of measurements.

Operations

Here are the flow changes during the month:

Alabama Gates from 0 cfs to 12 cfs on October 2nd, 2015
Alabama Gates from 12 cfs to 0 cfs on October 6th, 2015

LORP Intake from 60 cfs to 50 cfs on October 16th, 2015
LORP Intake from 50 cfs to 45 cfs on October 23rd, 2015
LORP Intake from 45 cfs to 42.2 cfs on October 28th, 2015

Diversion to Thibaut Pond from 0 cfs to 0.5 cfs on October 16th, 2015
Diversion to Winterton Waterfowl from 6 cfs to 1.6 cfs on October 16th, 2015

Waterfowl Area Monthly Report

Synopsis (for Runoff Year 2015-16)
The runoff forecast for runoff year 2015-16 is 36%, so the waterfowl acreage goal for this year is 180 acres.

On April 1st, 2015 the Thibaut Waterfowl Area inflow was reduced to 0 cfs, the Drew Slough Waterfowl Area was reduced to 0 cfs and the Winterton Waterfowl Area inflows were turned on to 6.6 cfs.

On May 1st, 2015 the flows to the Winterton area were reduced to 5.6 CFS.

On May 6th, 2015 the wetted perimeter was measured with GPS. The wetted area for the middle of the spring season was measured to be 235 acres for Drew Slough and Winterton was measured to have an area of 86 acres.

On June 1st, 2015 the flows to the Winterton area were increased to 6.0 CFS.

On July 10th, 2015 the Winterton wetted area was measured with GPS and was 171 acres.

On September 15th, the Winterton wetted area was measured with GPS and was 221 acres. Fall flows to Winterton remained at 6.0 cfs.

On October 16th, flows to Winterton were decreased to 1.6 cfs, and flows to Thibaut Waterfowl Area were increased to 0.5 cfs.

Quality Assurance and Calibration Procedures

The Los Angeles Department of Water and Power has a set standard to assure quality of all hydrological data collected. Procedures used to QA data vary based on the type of data collected and the device used to measure flow.
Data collected from sites utilizing area velocity flow meters are electronically monitored continuously. Sites are physically visited most days of the week to assure debris or vandalism hasn't affected the reading. Errors in the data collected may arise from several sources:

1. The transducers which detect the stage height and velocities have a tendency to drift.
2. Power outages occur occasionally thereby preventing the recording of data to the data loggers.
3. Occasionally the data loggers themselves malfunction.
4. Data can be lost or corrupted when it is transferred from the data loggers to the laptop.

Errors in discharge can originate from the instability of the relationship between velocity and stage height. This relationship varies temporally. It is affected by changes in the streambed that results from the flow of water over the bed, such as scour and fill, aquatic growth, ice, debris, or bed roughness.

To compensate for changes in the constantly shifting conditions multiple current meter measurements at each location per USGS standards are conducted per month. The current meter shots are taken at 2 foot intervals horizontally across the lined sections or 1 foot intervals at the sites where the measurements are taken in culverts. In each vertical section two separate measurements are taken (0.2 and 0.8) of the depth to achieve the best velocity average in the vertical. These vertical discharges are then added together to obtain a total flow in the section. The current meter data is logged in an on-board computer tracking the measurements as taken. That data is then extracted from the on-board computer to a PC using the FlowPack software that allows analysis of the data for erroneous measurements and is then converted to an Excel spreadsheet for ease of storage and printing. See Examples 1 – 3 for printout of software used to validate the current meter data.

Current meter data is used to develop velocity index tables. The tables require a minimum of 6 meter shots. After a table has been developed it is then downloaded into the on-site SonTek software which takes into account any variables within the meter section and applies any shifts to the discharge.

Data is collected and logged every 10 minutes utilizing SonTek area velocity flow meters. The data is downloaded from the meters once per month utilizing software provided by SonTek. The software "ViewArgonaut" gives us the ability to check items relevant to the performance of the meter. Battery voltage, beam strength, noise ratios, depth, and cell distance. (See Example 4) The software provides a trend of the data collected and displays it for quick comparisons, flagging discrepancies, one day at a time. Utilizing the ViewArgonaut software monthly reports are generated and the data is

reviewed. Using the current meter data collected during the month shifts are applied to the discharge to assure accuracy.

Augmentation Flows

Flows at several of the augmentation points are measured using weirs and flumes at sites that were pre-existing. Billy Lake has a one foot Parshall flume, Locust and Georges Returns have three foot weirs installed. All have stilling wells with dataloggers installed. The water surface elevation in the stillwell is measured each time the site is visited and verified it matches the staff gage for correct water depth through the measuring device. The still wells are flushed once every two months to assure the communication line is open and free of debris. The gage height data is logged on a module every 15 minutes. The modules are changed and processed every two weeks. Software used to process the data gives an hourly average gage and converts it to flow. It also gives the maximum and minimum flows for each day and time stamps it. The data is reviewed for any discrepancies which can be caused as a result of debris plugging the measuring device, a plugged stillwell, low batteries, etc.
